

# Do working memory deficits cause social problems in ADHD?

OPEN METHODS, OPEN DATA, AND PRELIMINARY  
RESULTS

JOSEPH RAIKER, PH.D., MICHAEL KOFLER, PH.D., MILEINI CAMPEZ, M.S., KELCEY LITTLE, B.S.

# “Crowdsource our experiment”

## Visuospatial Task

				
Black Dot 1	Black Dot 2	Red Dot	Black Dot 3	Correct Response Sequence

## Phonological Task

<b>6</b>	<b>2</b>	<b>M</b>	<b>5</b>	Verbal Response: 2, 5, 6, M
				Correct Response Sequence

# Good ideas we didn't use (but hope you will!)

- ▶ Use child confederate
- ▶ Manipulate group size, tasks involving more than 2 children
- ▶ Manipulate emotional valence of tasks
- ▶ Design alternate tasks

# Social-working memory task development

		Working Memory	
		Low	High
Modality	Verbal		
	Spatial

# Measuring social behavior

- ▶ Peer ratings
- ▶ Self ratings
- ▶ Examiner (live global ratings)
  - ▶ Hoza et al. (2000)
- ▶ Observer (videotaped granular ratings)
  - ▶ Normand et al. positive/negative/neutral affect
  - ▶ Erhardt & Hinshaw (1994) codes (e.g., prosocial, non-compliance/disruption, verbal aggression)
  - ▶ Mikami et al. (2007) verbalization codes

1. What is your name? _____						
2. What is your partner's name? _____						
For the following, answer each question on a scale from 1 to 7.						
1. How friendly was the child to you?						
1	2	3	4	5	6	7
Not at all friendly			A little friendly			Very friendly
2.						
a. Did the child try hard <b>to work together</b> with you?						
1	2	3	4	5	6	7
Did not try at all			Tried a little			Tried very hard
b. Did the child try hard <b>to do good</b> on the games?						
1	2	3	4	5	6	7
Did not try at all			A little good			Tried very hard
3. Was the child <b>good at playing</b> the games?						
1	2	3	4	5	6	7
Not good			A little good			Very good
4. Was the child <b>good at cooperating</b> with you?						
1	2	3	4	5	6	7
Not good			A little good			Very good
5. How happy was the child during the games?						
1	2	3	4	5	6	7
Not happy			A little happy			Very happy
6. How frustrated was the child during the games?						
1	2	3	4	5	6	7
Not frustrated			A little frustrated			Very frustrated
7. Was the child nice to you?						
1	2	3	4	5	6	7
Not nice			A little nice			Very nice
8. Did the child say mean things about themselves?						
1	2	3	4	5	6	7
No			A few mean things			A lot of mean things
9.						
a. Were things the child said <b>helpful for working together</b> ?						
1	2	3	4	5	6	7
No			A little helpful			Very helpful
b. Were things the child said <b>helpful for playing the games</b> ?						
1	2	3	4	5	6	7
No			A little helpful			Very helpful

# Feasibility of the dyadic social-working memory tasks

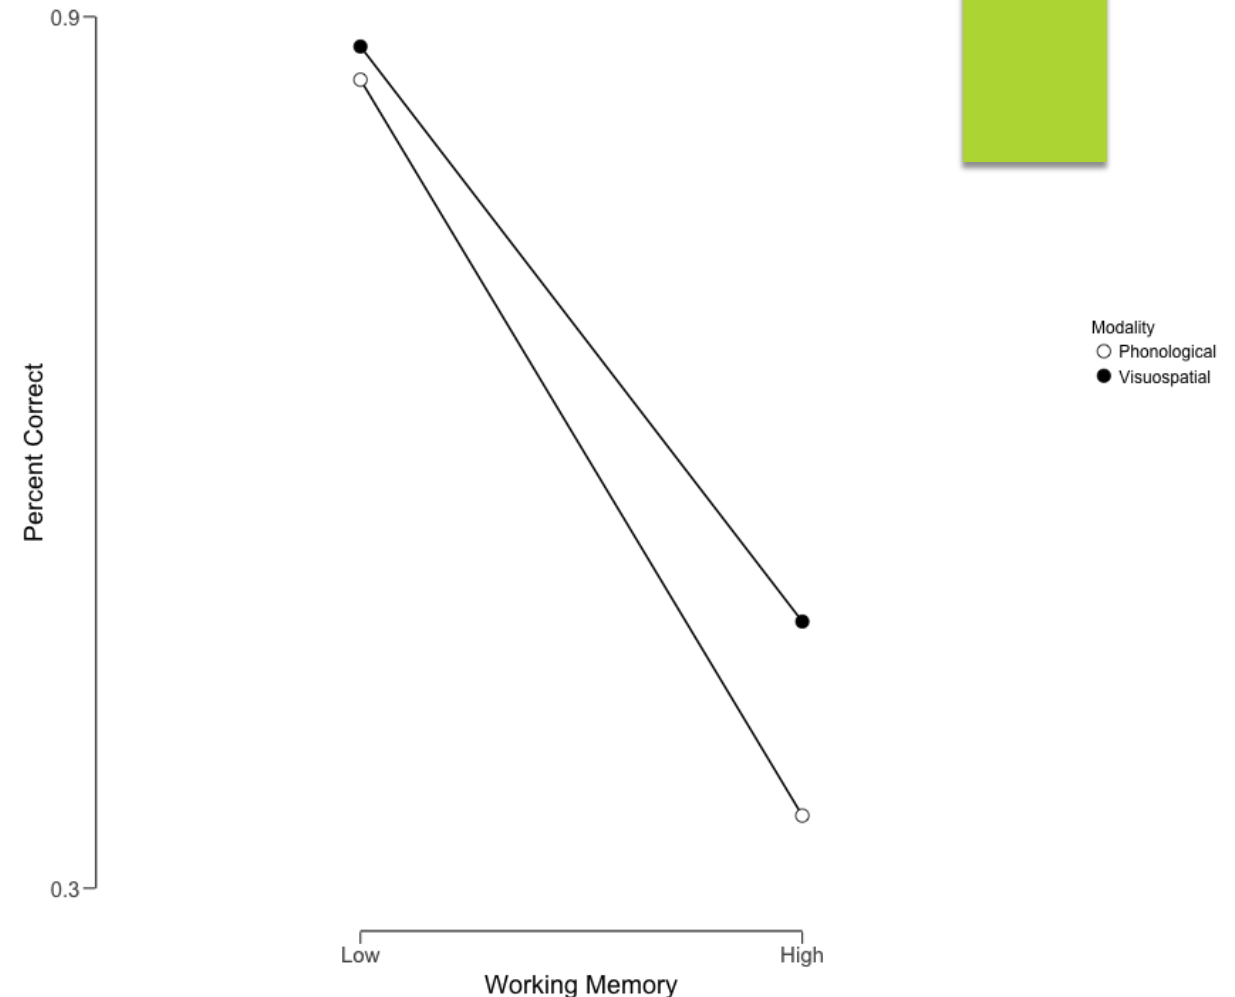

Twenty-nine children were administered at least one task; however, the current results focus on the 24 children (12 dyads) who completed both versions (i.e., high WM, low WM) of the phonological and visuospatial tasks.

# Feasibility of the dyadic social-working memory manipulation

- ▶ Scores reflect each child dyad's performance (not individual children)
- ▶ Averaged stimuli correct per trial across the first six trials (or fewer if dyad failed to complete six trials in 15 minutes)

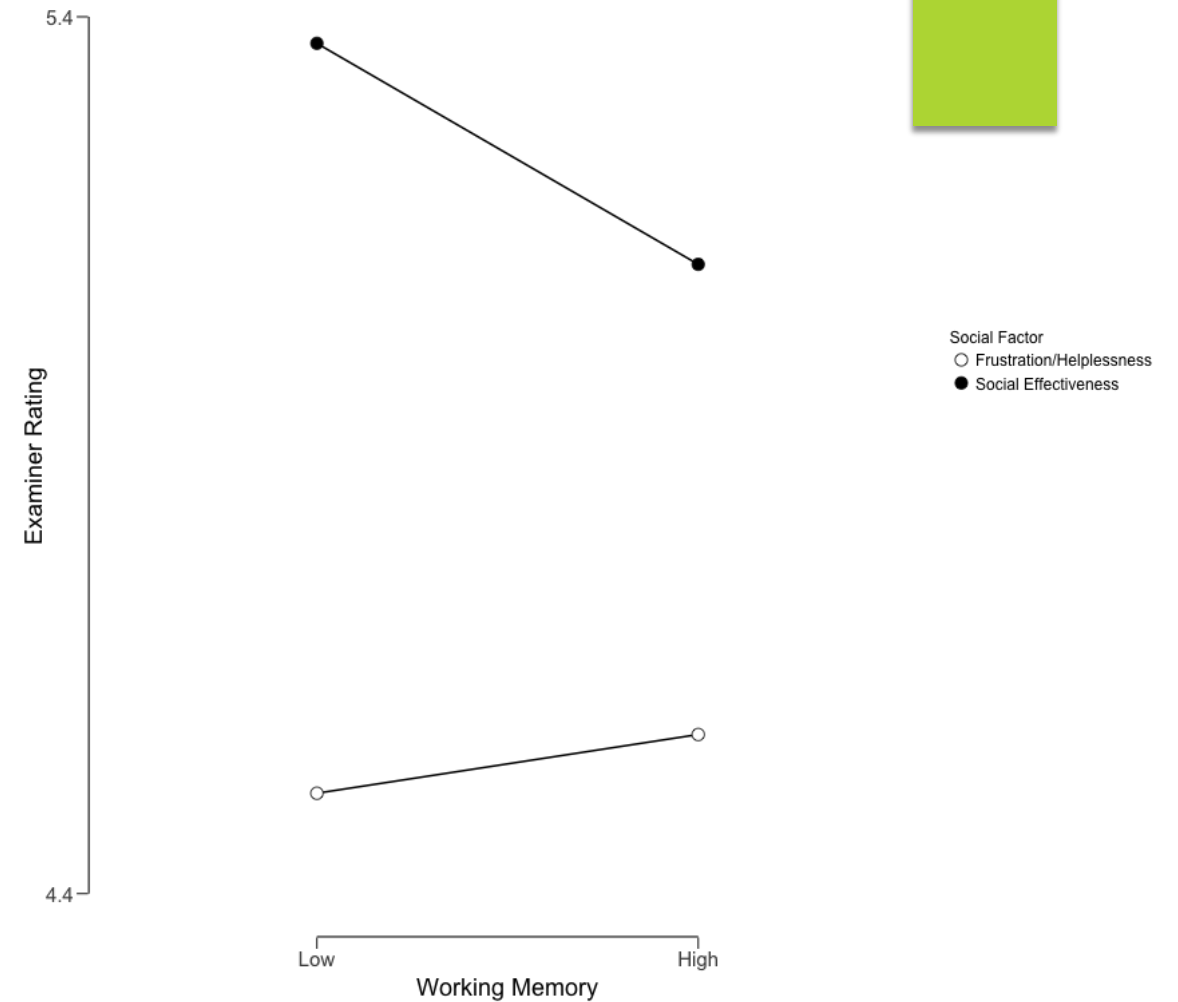

Paired Samples T-Test

			statistic	df	p	Mean difference	SE difference	Cohen's d
PH Percent Correct (Low WM)	PH Percent Correct (High WM)	Student's t	11.8	23.0	< .001	0.507	0.0431	2.40
VS Percent Correct (Low WM)	VS Percent Correct (High WM)	Student's t	11.8	23.0	< .001	0.396	0.0336	2.40

# Feasibility of examiner-rated social behavior

- ▶ Scores reflect each individual child
- ▶ Averaged across items loading on relevant factors (i.e., social effectiveness, frustration/helplessness; Pelham et al., 2001)
- ▶ Collapsed across PH and VS tasks so unclear if effect is different across modality
  - ▶ Currently recoding via videotape review

Paired Samples T-Test

			statistic	df	p	Mean difference	SE difference	Cohen's d
Social Effectiveness (Low WM)	Social Effectiveness (High WM)	Student's t	1.245	23.0	0.226	0.2521	0.202	0.254
Frustration/Helplessness (Low WM)	Frustration/Helplessness (High WM)	Student's t	-0.585	23.0	0.564	-0.0670	0.115	-0.119

# Setting expectations

How big of an effect can we reasonably expect?

- ▶ Previous studies linking working memory & social problems in ADHD
  - ▶  $\beta = .18-.36$ 
    - ▶ i.e., 1 SD change in WM = 0.18-0.36 SD change in social skills
- ▶ Estimated size of our WM manipulation
  - ▶ Cohen's  $d = 2.40$ 
    - ▶ i.e., 2.40 SD change in working memory from low to high condition
- ▶ Expected change in social behavior during low to high conditions (assuming WM/social correlation is fully causal)
  - ▶ Cohen's  $d = 0.43-0.86$

# Questions

- ▶ What data do you want to see to be convinced that working memory manipulation was successful?
- ▶ How to best analyze the dyadic WM task data?
  - ▶ Different child pairing across conditions
- ▶ Feedback on peer, examiner (global), and observer (granular) coding schemes?
- ▶ Proposals for additional behavioral codes?
  - ▶ Opportunities for collaboration: Your coding scheme, our coders!
- ▶ Control group(s)? Cross-diagnosis dyads?
- ▶ Experiment modifications?
